

WHAT IS CLAIMED IS:

Sub C5
 5 15. A method for increasing the bearing capacity of foundation soils for buildings comprising: providing a plurality of holes spaced from each other deep in the soil; injecting into the soil, through said holes, a substance which expands as a consequence of a chemical reaction; producing compaction of the soil contiguous to the injection zone due to the expansion of said substance injected into the soil, further comprising the step of constantly monitoring the level of the soil and/or building overlying the injection zone to detect the moment when the building and/or the soil surface, overlying said injection zone, begins to raise which is the moment in which the compaction of the soil has reached levels generally higher than the required minimum value, and wherein the expansion of the injected substance is very fast with a potential increase in volume of the expanded substance being at least five times the volume of the substance before expansion.

Sub D1
 16. A method according to claim 15, wherein the injecting step is repeated at different depth levels for producing compaction of the masses or layers of treated soil.

20 17. A method according to claim 16, wherein said different depth levels are spaced by approximately 1 m from each other, at each level a greater bearing capacity than the required ^{minimum value} ~~one~~ being obtainable.

18. A method according to claim 15, wherein said monitoring step is performed with a laser level apparatus.

25 19. A method according to claim 16, wherein said holes are provided vertically, the injection steps being performed continuously along rising columns wherein tree-like shapes are formed with a very irregular configuration with protrusions, bumps and projections of considerable size produced by different resistance to compaction of the soil, and by the presence of interstices or fractures in the soil.

30 20. A method according to claim 19, wherein an entire thickness of the

On

000000000000

23. A method according to claim 19, wherein the distance between two adjacent holes is between 0.5 m and 3 m.

25. A method according to claim 16, wherein the injection step comprises several active injection phases alternated with suitable pauses.

20 27. A method according to claim 22, wherein the water content is of
3.44%, by weight.
